

String Methods

s.isidentifier()

```
s = 'length1' --> True  
s = '1length' --> False
```

Variable can not start with a number so it will return false

- This method will check if it gives the valid name of the variable
- For keywords also it will return true
s = 'if' --> True

s.isprintable()

- All the ASCII letters, other language letters are printable but there are escape characters \n \t \r are not printable so it will return false

```
s = 'hello' --> True  
s = 'hello\nhow are you' --> False
```

s.isdecimal()

It will say if there are decimals present in the string

```
s = '125' --> True  
s = '1.25' --> False
```

What are decimals?? Decimals are the numbers between 0 - 9

s.isdigit()

```
s = '168' --> True
```

- If you have special numbers it will return true
- But in s.isdecimal() it will return False

s.isnumeric()

```
s = '51/2' --> True
```

- But in decimal and digit it will be false
- It will return true to any number
